Press Release

Finnish innovation Multi Handset 3 In 1 offers an unlimited amount of new possibilities for TETRA network users.

Stop Noise Finland Ltd is releasing in PMRExpo 2010 new highly advanced features for the unique 3 in 1 Multi Handset for TETRA terminals. These features include an RFID reader and biometric identification methods such as fingerprint reading and face recognition.

Laukaa, Finland 23rd November 2010: The Multi Handset 3 in 1 from Stop Noise is a handset for radio terminals of digital TETRA network which is used by authorities and other professionals worldwide. This handset has data and imaging features integrated to a traditional users' favorite audio accessory, speaker microphone. In PMRExpo 2010 – a professional radio exhibition in Germany – Stop Noise publishes new features for the Multi Handset which will further emphasize this device's versatility.

The Multi Handset will be available in many different versions. All of them include the normal audio functionality and good ergonomics of a speaker microphone and in addition a bunch of other features: a keypad for controlling the radio terminal, an accelerometer for Man Down alert, MicroSD slot for internal memory and a USB interface. In addition the customer can choose the most suitable data collection technology from e.g. camera barcode reader, RFID reader and fingerprint scanner. The beauty of the device is in the possibility to send the acquired data over TETRA network to a database from where an instant feedback can be sent to desired location, for example the user's terminal.

"The Multi Handset is the only handheld TETRA terminal's accessory in the world to combine audio, data and image features in a single device (3 in 1). It offers an interface for nearly all data collection technologies (barcodes, RFID, biometric identification, etc.) and enables transferring the collected data via TETRA network to different customer specific applications and to experts for further processing. Multi Handset allows delivering customer specific complete solutions to TETRA users." explains Mr. Markku Nieminen, Managing director of Stop Noise.
